(54) Title: FUSED PYRIMIDINES AS ANTAGONISTS OF THE CORTICOTROPIN RELEASING FACTOR (CRF)

(I)

(57) Abstract: The present invention provides compounds of formula (I) including stereoisomers, prodrugs and pharmaceutically acceptable salts or solvates thereof wherein the variables are as defined in the description, processes for their preparation, pharmaceutical compositions containing them and their use in the treatment of conditions mediated by corticotropin-releasing factor (CRF).

## FUSED PYRIMIDINES AS ANTAGONISTS OF THE CORTICOTROPIN RELEASING FACTOR (CRF)

The present invention relates to bicyclic derivatives, to processes for their preparation, to pharmaceutical compositions containing them and to their use in therapy.

5

The first corticotropin-releasing factor (CRF) was isolated from ovine hypothalami and identified as a 41-amino acid peptide (Vale et al., Science 213: 1394-1397,1981).

10

CRF has been found to produce profound alterations in endocrine, nervous and immune system function. CRF is believed to be the major physiological regulator of the basal and stress-release of adrenocorticotrophic hormone ("ACTH"), Bendorphin and other proopiomelanocortin ("POMC")-derived peptides from the anterior pituitary (Vale et al., Science 213: 1394-1397,1981).

15

In addition to its role in stimulating the production of ACTH and POMC, CRF appears to be one of the pivotal central nervous system neurotransmitters and plays a crucial role in integrating the body's overall response to stress.

Administration of CRF directly to the brain elicits behavioral, physiological and endocrine responses identical to those observed for an animal exposed to a stressful environment.

20

Accordingly, clinical data suggests that CRF receptor antagonists may represent novel antidepressant and/or anxiolytic drugs that may be useful in the treatment of the neuropsychiatric disorders manifesting hypersecretion of CRF.

25

The first CRF receptor antagonists were peptides (see, e.g., Rivier et al., U.S. Patent No. 4,605,642; Rivier et al., Science 224: 889,1984). While these peptides established that CRF receptor antagonists can attenuate the pharmacological responses to CRF, peptide CRF receptor antagonists suffer from the usual drawbacks of peptide therapeutics including lack of stability and limited oral activity. More recently, small molecule CRF receptor antagonists have been reported.

30

WO 95/10506 describes inter alia compounds of general formula (A) with general CRF antagonist activity

35

wherein Y may be CR29; V and Z may be nitrogen and carbon, R3 may correspond to an amine derivative and R4 may be taken together with R29 to form a 5-membered ring and is -CH(R28) when R29 is-CH(R30). There are no specific disclosures of compounds corresponding to this definition.

WO 95/33750 also describes compounds of general formula (B) having CRF antagonistic activity,

in which A and Y may be nitrogen and carbon and B may correspond to an amine derivative.

- 5 The compounds comprised in general formula (B), whose preparation is included in the Experimental Part of WO 95/33750, are characterized by having always at least one substituent other than hydrogen on the atoms different from Y in the 5-membered ring, when saturated.

- 10 WO 98/08846 describes compounds of general formula (C) having CRF antagonistic activity,

wherein A may be nitrogen, G may be nitrogen or carbon, B may be an amino derivative and the other groups have the meanings as defined.

- 15 The compounds comprised in general formula (C), in which A may be nitrogen and B may be an amino derivative, whose preparation is included in the Experimental Part WO 98/08846, are characterized by having always at least a substituent other than hydrogen on the atoms different from G in the 6-membered ring, when saturated.

- 20 Due to the physiological significance of CRF, the development of biologically-active small molecules having significant CRF receptor binding activity and which are capable of antagonizing the CRF receptor remains a desirable goal. Such CRF receptor antagonists would be useful in the treatment of endocrine, psychiatric and neurologic conditions or illnesses, including stress-related disorders in general.

- 25 While significant strides have been made toward achieving CRF regulation through administration of CRF receptor antagonists, there remains a need in the art for effective small molecule CRF receptor antagonists. There is also a need for pharmaceutical compositions containing such CRF receptor antagonists, as well as methods relating to the use thereof to treat, for example, stress-related disorders. The present invention fulfills these needs, and
- 30 provides other related advantages.

In particular the invention relates to novel compounds which are potent and specific antagonists of corticotropin-releasing factor (CRF) receptors.

- 35 The present invention provides compounds of formula (I) including stereoisomers, prodrugs and pharmaceutically acceptable salts or solvates thereof

In general, the compounds of structure (I) may be made according to the organic synthesis techniques known to those skilled in this field, as well as by the representative methods set forth in the Examples.

30 Compounds of formula (I), and salts and solvates thereof, may be prepared by the general methods outlined hereinafter. In the following description, the groups R, R<sub>1</sub>, R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub>, R<sub>5</sub>, R<sub>6</sub>, R<sub>7</sub>, R<sub>8</sub>, R<sub>9</sub>, R<sub>10</sub>, and n have the meanings as previously defined for compounds of formula (I) unless otherwise stated.

35 Compounds of formula (I) may be prepared by reaction of a compound of formula (II), wherein L is a leaving group selected in a group consisting from halogens (preferably chlorine) or reactive residue of a sulphonic acid (e.g. mesylate, tosylate, triflate).

with the amino compound  $\text{NHR}_2\text{R}_3$  (III). The reaction can be optionally carried out in an aprotic solvent such as NN-dimethylformamide in the presence, if desired, of a strong base such as sodium hydride and with heating.

Alternatively, when  $\text{NR}_2\text{R}_3$  represents a cycle, compounds (II) may react with hydrazine to give the corresponding hydrazino derivatives and then they may be cyclised to the desired final compound (I).

Compounds of formula (II), wherein X is nitrogen are equivalent to compounds of formula (IIa), may be prepared by cyclisation of a compound of formula (IV), wherein p is 1 or 2 and Ra is a suitable protecting group for the amino group. The activation of the hydroxy group is performed by conversion into a suitable leaving group, such as mesylate. The deprotection of the amino protecting group can be performed, for example, using an acid, such as trifluoroacetic acid, in an aprotic solvent, like dichloromethane.

The cyclisation may take place in an aprotic solvent such as tetrahydrofuran and in the presence of a tertiary amine such as triethyl amine.

Compounds of formula (IV), wherein p is 1 are equivalent to compounds of formula (IVa), may be prepared by oxidation of a compound of formula (V) to the corresponding aldehyde of formula (VI), followed by reduction to alcohol.

The oxidation is carried out, for example, with ozone at low temperature, e.g.  $-78^\circ\text{C}$ , in a solvent such as dichloromethane.

The reduction takes places using for example sodium borohydride in a solvent such as methanol.

Compounds of formula (IV), wherein p is 2, may be prepared by reduction of an aldehyde of formula (VII) with a suitable reducing agent, such as diisobutylaluminumhydride in usual conditions (aprotic solvent such as dichloromethane at low temperature, e.g.  $0^\circ\text{C}$ ).

Compounds of formula (VII) may be prepared by Wittig reaction of a compound of formula (VIII) with a phosphorus ylide (IX), wherein  $\text{R}_6$  is phenyl or a phenyl derivative, followed by hydrolysis with an acid (e.g. hydrochloric acid). The reaction is carried out in an aprotic solvent such as acetonitrile or an ether such as tetrahydrofuran.

Aldehydes (VIII) may be obtained by oxidation of a compound of formula (V).

The oxidation is carried out in the presence of ozone at low temperature, e.g.  $-78^\circ\text{C}$ , in a solvent such as dichloromethane.

- 10 Alternatively compounds of formula (IVc) may be prepared by reaction of a compound of formula (IX) with amine (X), in which  $\text{R}_b$  is a suitable protecting group for the hydroxy group.

The reaction preferably takes place in an aprotic solvent such as dichloromethane or  $\text{N,N}$ -dimethyl formamide optionally in the presence of a tertiary amine (e.g. triethylamine).

Compounds (IVc) may be subjected to deprotection and then activation of the hydroxy group (e.g. mesylate) as described before followed by in situ cyclisation

Compounds of formula (IX) may be prepared by reduction of an ester of formula (XI), with a suitable reducing agent, such as diisobutylaluminumhydride.

Compounds of formula (XI) may be prepared from compounds of formula (XII) by conversion of the hydroxy groups in suitable leaving groups. For example, the halogenation reaction may be carried out using conventional methods known in the art. Thus, for example,

the reaction may be carried out by treatment with  $\text{PO}(\text{Hal})_3$ , wherein Hal is preferably chlorine.

- 5 Compounds of formula (V), may be prepared by reaction of a compound of formula (XIII) with amine (X), followed by protection of the amino group.

The reaction preferably takes place in an aprotic solvent such as tetrahydrofuran, dichlorometane or N,N-dimethylformamide in the presence of a strong base such sodium hydride and by heating.

10

Compounds of formula (II), wherein X is a carbon atom are equivalent to compounds of formula (IIb), may be prepared by conversion of the hydroxy group of compounds of formula (XIV) into a leaving group.

- 15 For example, the halogenation reaction may be carried out using conventional methods known in the art. Thus, e.g. the reaction may be carried out by treatment with  $\text{PO}(\text{Hal})_3$ , wherein Hal is preferably chlorine.

Compounds of formula (XIV) may be prepared by cyclisation of a compound of formula (XVI) with a salt (e.g. hydrochloride) of acetamidine (XV).

- 20 The reaction is carried out in the presence of an alkaline organic base C1-C4 (e.g. sodium methoxide) in a solvent such as methyl alcohol.

Compounds of formula (XVI) may be prepared by cyclisation of a compound of formula (XVII), in which  $\text{R}_{11}$  is a linear or branched C1-C4 alkyl and p is defined as above.

- 25 The cyclisation may be carried out in the presence of an organic alkaline C1-C4 alkoxyde (e.g. sodium methoxide) in an aprotic solvent such as N,N-dimethylformamide or toluene and at temperature ranging from 20° to 100°C.

Compounds of formula (XVII) can be prepared by reaction of a compound of formula (XVIII) with a compound of formula (XIX), wherein L is preferably a bromine or iodine atom.

5 The reaction is carried out in aprotic solvent such as an ether e.g. tetrahydrofuran at low temperature, e.g.  $-78^{\circ}\text{C}$ , and in the presence of a strong base such as Lithium diisopropylamide.

10 Alternatively, compounds of formula (XVIa), corresponding to compounds of formula (XVI) when n is 2, may be prepared according to the following scheme from cyclohexanone. It can be converted to its reactive enol ether (such as a triflate, as in *Lai and McAllister; Synth. Commun.*; 29; 3; 1999; p 409), then coupled with an organic metallic derivative of R (such as a boronic acid derivative, as in *Suzuki, Akira; J.Org.Chem.*; 58; 8; 1993; p 2201) to give the substituted cyclohexene, which can be epoxidised, using for example chloro-  
 15 peroxybenzoic acid, and converted to a carbonyl group under acidic conditions (using, for example, sulfuric acid, as in *Crotti, P. et al; Tetrahedron*; 29; 1973; p 155). The ketone thus obtained can be carboxymethylated, using a strong base (such as lithium diisopropyl amide) and an acylating agent (such as ethyl cyanoformate).

20 In another alternative, compounds of formula (XVIb), corresponding to compounds of formula (XVI) when n is 1, may be prepared according to the following scheme from 2-chloro-cyclopentanone, by reaction with a suitable Grignard derivative of the group R and then carboxymethylated as described above.

25 Compounds of formula (XI), (XII), (XIII), (XVIII) and (XIX) are either known compounds or may be prepared by analogous methods to those described for known compounds.

30 Pharmaceutical acceptable salts may also be prepared from other salts, including other pharmaceutically acceptable salts, of the compound of formula (I) using conventional methods.

The compounds of formula (I) may readily be isolated in association with solvent molecules by crystallisation or evaporation of an appropriate solvent to give the corresponding solvates.

35 When a specific enantiomer of a compound of general formula (I) is required, this may be obtained for example by resolution of a corresponding enantiomeric mixture of a compound of formula (I) using conventional methods. Thus the required enantiomer may be obtained from the racemic compound of formula (I) by use of chiral HPLC procedure.

The subject invention also includes isotopically-labeled compounds, which are identical to those recited in formulas I and following, but for the fact that one or more atoms are replaced by an atom having an atomic mass or mass number different from the atomic mass or mass number usually found in nature. Examples of isotopes that can be incorporated into

5 compounds of the invention include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorous, fluorine, iodine, and chlorine, such as  $^3\text{H}$ ,  $^{11}\text{C}$ ,  $^{14}\text{C}$ ,  $^{18}\text{F}$ ,  $^{123}\text{I}$  and  $^{125}\text{I}$ .

Compounds of the present invention and pharmaceutically acceptable salts of said compounds that contain the aforementioned isotopes and/or other isotopes of other atoms are within the scope of the present invention. Isotopically-labeled compounds of the present

10 invention, for example those into which radioactive isotopes such as  $^3\text{H}$ ,  $^{14}\text{C}$  are incorporated, are useful in drug and/or substrate tissue distribution assays. Tritiated, i.e.,  $^3\text{H}$ , and carbon-14, i.e.,  $^{14}\text{C}$ , isotopes are particularly preferred for their ease of preparation and detectability.  $^{11}\text{C}$  and  $^{18}\text{F}$  isotopes are particularly useful in PET (positron emission tomography), and  $^{125}\text{I}$  isotopes are particularly useful in SPECT (single photon emission computerized

15 tomography), all useful in brain imaging. Further, substitution with heavier isotopes such as deuterium, i.e.,  $^2\text{H}$ , can afford certain therapeutic advantages resulting from greater metabolic stability, for example increased *in vivo* half-life or reduced dosage requirements and, hence, may be preferred in some circumstances. Isotopically labeled compounds of formula I and following of this invention can generally be prepared by carrying out the procedures

20 disclosed in the Schemes and/or in the Examples below, by substituting a readily available isotopically labeled reagent for a non-isotopically labeled reagent.

40 It will be appreciated that reference to treatment is intended to include prophylaxis as well as the alleviation of established symptoms.

Compounds of formula (I) may be administered as the raw chemical but the active ingredient is preferably presented as a pharmaceutical formulation.

Accordingly, the invention also provides a pharmaceutical composition which comprises at least one compound of formula (I) or a pharmaceutically acceptable salt thereof and formulated for administration by any convenient route. Such compositions are preferably in a form adapted for use in medicine, in particular human medicine, and can conveniently be formulated in a conventional manner using one or more pharmaceutically acceptable carriers or excipients.

Thus compounds of formula (I) may be formulated for oral, buccal, parenteral, topical (including ophthalmic and nasal), depot or rectal administration or in a form suitable for administration by inhalation or insufflation (either through the mouth or nose).

For oral administration, the pharmaceutical compositions may take the form of, for example, tablets or capsules prepared by conventional means with pharmaceutically acceptable excipients such as binding agents (e.g. pregelatinised maize starch, polyvinylpyrrolidone or hydroxypropyl methylcellulose); fillers (e.g. lactose, microcrystalline cellulose or calcium hydrogen phosphate); lubricants (e.g. magnesium stearate, talc or silica); disintegrants (e.g. potato starch or sodium starch glycollate); or wetting agents (e.g. sodium lauryl sulphate). The tablets may be coated by methods well known in the art. Such long acting formulations may be administered by implantation (for example subcutaneously or intramuscularly) or by intramuscular injection. Thus, for example, the compounds of the invention may be formulated with suitable polymeric or hydrophobic materials (for example as an emulsion in an acceptable oil) or ion exchange resins, or as sparingly soluble derivatives, for example, as a sparingly soluble salt.

20       For intranasal administration, the compounds of the invention may be formulated as solutions for administration via a suitable metered or unitary dose device or alternatively as a powder mix with a suitable carrier for administration using a suitable delivery device.

25       A proposed dose of the compounds of the invention is 1 to about 1000mg per day. It will be appreciated that it may be necessary to make routine variations to the dosage, depending on the age and condition of the patient and the precise dosage will be ultimately at the discretion of the attendant physician or veterinarian. The dosage will also depend on the route of administration and the particular compound selected.

30       Thus for parenteral administration a daily dose will typically be in the range of 1 to about 100 mg, preferably 1 to 80 mg per day. For oral administration a daily dose will typically be within the range 1 to 300 mg e.g. 1 to 100 mg.

25 7-(2,4-Dichlorophenyl)-4-[3-(4-fluorophenyl)pyrazol-1-yl]-2-methyl-6,7-dihydro-5H-pyrrolo[2,3-*d*]pyrimidine (1-10-22)

3-(3-fluoro phenyl) pyrazole (3 eq, 0.19 mmol) was added to a suspension of NaH 80%/oil (6 mg, 3eq) in anh. DMF (0.5 mL) at 0°C. After 10 min intermediate 8 (20 mg, 0.064 mmol) was added and the solution was heated in a sealed vial at 100°C for 3 hr. The reaction mixture was diluted with water and extracted with EtOAc (3x). The combined organic extracts were dried over anh. Na<sub>2</sub>SO<sub>4</sub>, the solids were filtered and the solvent evaporated. The crude oil was purified by flash chromatography (silica gel, cHex/EtOAc 90:10). The title compound was obtained as a white solid (79%)

35 7-(2,4-Dichlorophenyl)-4-[3-(4-chlorophenyl)pyrazol-1-yl]-2-methyl-6,7-dihydro-5H-pyrrolo[2,3-*d*]pyrimidine (1-10-23)

3-(3-chloro phenyl) pyrazole (3 eq, 0.19 mmol) was added to a solution of NaH 80%/oil (6 mg, 3eq) in anh. DMF (0.5 mL) at 0°C. After 10 min, intermediate 8 (20 mg, 0.064 mmol) was added and the solution was heated in a sealed vial at 100°C for 3 hr. The reaction mixture was diluted with water and extracted with EtOAc (3x). The combined organic extracts were dried over anh. Na<sub>2</sub>SO<sub>4</sub>, the solids were filtered and the solvent evaporated. The crude oil was purified by flash chromatography (silica gel, cHex/EtOAc 90:10). The title compound was obtained as a white solid (60%).

1-[7-(2,4-Dichlorophenyl)-2-methyl-6,7-dihydro-5H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazole-3-carbonitrile (1-10-27)

To a suspension of NaH 80%/oil (4 mg, 3 eq) in anh. DMF (0.3 mL), at r.t., under N<sub>2</sub>, was added 3-cyano-pyrazole (14 mg, 3 eq) and the reaction mixture was stirred at r.t. for 30 min. **Intermediate 8** (15 mg, 0.048 mmol) was added and the reaction mixture was stirred at 100°C (screw cap vial) for 4 hr. The solvent was evaporated and the residue taken up in H<sub>2</sub>O and extracted with CH<sub>2</sub>Cl<sub>2</sub> (3x). The combined organic extracts were dried over anh. Na<sub>2</sub>SO<sub>4</sub>, the solids were filtered and the solvent evaporated. The crude product was purified by flash chromatography (silica gel, cHex/EtOAc 8:2) to give the title compound as a white solid (11 mg, 62%).

N-{5-Cyclopropyl-2-[7-(2,4-dichlorophenyl)-2-methyl-7H-pyrrolo[2,3d]pyrimidin-4-yl]-2H-pyrazol-3-yl}acetamide (1-10-28)

To a suspension of NaH 95% (3.7 mg) in anh. DMF (0.5 mL) was added *N*-(5-cyclopropyl-2H-pyrazol-3-yl)-acetamide (24 mg) and the mixture was stirred for 20 min at r.t. **Intermediate 8** (15 mg) was then added and the solution was heated in a sealed vial from 70°C to 140°C for 23 hr. It was then partitioned between H<sub>2</sub>O and EtOAc. The organic layer was washed with brine, dried with anh. Na<sub>2</sub>SO<sub>4</sub> and the solvent was removed under reduced pressure. The crude compound was purified by flash chromatography (silica gel, cHex/EtOAc 2:8) to give the title compound as a white solid (14 mg).

- 5 A solution of intermediate 8 (30 mg, 0.095 mmol) and hydrazine hydrate (0.095 mmol) in methanol (950  $\mu$ l) was heated at 130°C (screw cap vial) for 18hr. The mixture was then evaporated to dryness and the crude product obtained together with formyltrifluoroacetylrimide (43 mg, 0.3 mmol) in N-methylpyrrolidone (200  $\mu$ l) were heated at 100°C (screw cap vial) for 5hr. The mixture was then diluted with cold brine and extracted with EtOAc (3x). The combined organic extracts were dried over anh. Na<sub>2</sub>SO<sub>4</sub>, then filtered
- 10 and the solvent evaporated *in vacuo*. The crude compound was purified by flash chromatography (silica gel, EtOAc/cHex 9:1) to give the title compound as a white solid (99%).
- 15 The compound 1-11-1, whose analytical data are reported in the following Table 1-11, was prepared analogously using diacetamide instead of formyltrifluoroacetylrimide.

All the analytical data are set forth in the following Table 1-11.

7-(2,4-Dichlorophenyl)-2-methyl-4-(2-methyl-imidazol-1-yl)-6,7-dihydro-5H-pyrrolo[2,3-d]pyrimidine (1-12-3)

5 To a suspension of NaH 80%/oil (3 mg, 2 eq) in anh DMF (0.5 mL), at r.t., under N<sub>2</sub>, was added 2-methyl-imidazole (8 mg, 2 eq) and the reaction mixture was stirred for 20 min at r.t. Intermediate 8 (15 mg, 0.048 mmol) was then added and the reaction mixture was heated at 80°C (screw cap vial) for 90 min. It was then cooled down to r.t. and poured into EtOAc/sat.aq. NaCl. The phases were separated and the organic layer was washed with sat.aq. NaCl (2x) and dried over anh. Na<sub>2</sub>SO<sub>4</sub>. The solids were filtered and the solvent  
10 evaporated. The residue was purified by flash chromatography (silica gel, 8% MeOH/EtOAc) to give 6 mg of the title compound as a white solid (0.017 mmol, 35%)

The compounds 1-12-1, 1-12-2, 1-12-4, 1-12-5, 1-12-6 and 1-12-7, whose analytical data are reported in the following Table 1-12, were prepared analogously starting from the

1-[7-(2,4-Dichlorophenyl)-2-methyl-6,7-dihydro-5H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-imidazole-4-carboxylic acid phenylamide (1-12-8)

20 To a suspension of NaH 95% (3.7 mg) in anh. DMF (0.5 mL) was added 1H-imidazole-4-carboxylic acid phenylamide (27 mg) and the mixture was stirred for 20 min at r.t.. Intermediate 8 (15 mg) was then added and the solution was heated in a sealed vial from 70 to 120°C for 6 hr. It was then partitioned between H<sub>2</sub>O and EtOAc. The organic layer was washed with brine, dried with anh. Na<sub>2</sub>SO<sub>4</sub> and the solvent was removed under reduced pressure. The crude compound was purified by flash chromatography (silica gel, cHex/EtOAc 1:9) to give the title compound (9.8 mg) as a yellow solid.

#### EXAMPLE 5

##### CRF Binding Activity

5

CRF binding affinity has been determined in vitro by the compounds' ability to displace <sup>125</sup>I-oCRF and <sup>125</sup>I-Sauvagine for CRF1 and CRF2 SPA, respectively, from recombinant human CRF receptors expressed in Chinese Hamster Ovary (CHO) cell membranes. For membrane preparation, CHO cells from confluent T-flasks were collected in SPA buffer (HEPES/KOH 50mM, EDTA 2mM; MgCl<sub>2</sub> 10mM, pH 7.4.) in 50mL centrifuge tubes, homogenized with a Polytron and centrifuged (50'000g for 5min at 4°C: Beckman centrifuge with JA20 rotor). The pellet was resuspended, homogenized and centrifuged as before.

10

The SPA experiment has been carried out in Optiplate by the addition of 100 μL the reagent mixture to 1μL of compound dilution (100% DMSO solution) per well. The assay mixture was prepared by mixing SPA buffer, WGA SPA beads (2.5 mg/mL), BSA (1 mg/mL) and membranes (50 and 5 μg of protein/mL for CRF1 and CRF2 respectively) and 50 pM of radioligand.

15

The plate was incubated overnight (>18 hrs) at room temperature and read with the Packard Topcount with a WGA-SPA <sup>125</sup>I counting protocol.

20

EXAMPLE 6  
CRF functional assay

5 Compounds of the invention were characterised in a functional assay for the determination of their inhibitory effect. Human CRF-CHO cells were stimulated with CRF and the receptor activation was evaluated by measuring the accumulation of cAMP.

10 CHO cells from a confluent T-flask were resuspended with culture medium without G418 and dispensed in a 96-well plate, 25'000c/well, 100  $\mu$ L/well and incubated overnight. After the incubation the medium was replaced with 100  $\mu$ L of cAMP IBMX buffer warmed at 37°C (5mM KCl, 5mM NaHCO<sub>3</sub>, 154mM NaCl, 5mM HEPES, 2.3mM CaCl<sub>2</sub>, 1mM MgCl<sub>2</sub>; 1g/L glucose, pH 7.4 additioned by 1mg/mL BSA and 1mM IBMX) and 1 $\mu$ L of antagonist dilution in neat DMSO. After 10 additional minutes of incubation at 37°C in a plate incubator without CO<sub>2</sub>, 1 $\mu$ L of agonist dilution in neat DMSO was added. As before, the plate was incubated for 10 minutes and then cAMP cellular content was measured by using the Amersham RPA 538 kit.

# INTERNATIONAL SEARCH REPORT

International application No.  
PCT/GB 02/02029

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
  
Although claims 23-25 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☒ Claims Nos.: 1-25 (in part)  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:  
see FURTHER INFORMATION sheet PCT/ISA/210
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)

This International Searching Authority found multiple inventions in this International application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; It is covered by claims Nos.:

### Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.  
☐ No protest accompanied the payment of additional search fees.

## FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.2

Claims Nos.: 1-25 (in part)

The present claims partly relate to compounds defined by reference to a desirable characteristic or property, namely their ability of being metabolized in vivo to compounds structurally defined in the claims ("prodrugs") without giving technical (i. e. structural) information how to achieve this goal.

Since in-vivo-tests would have to be carried out to determine which compounds are included in this definition and it cannot be readily determined if e. g. existing compounds of the prior art may be metabolized in vivo to compounds structurally defined in the present claims, in this respect an unclarity results to such an extent (Art. 6 PCT) that a meaningful search and comparison with the prior art is impossible. The search has thus been limited to compounds structurally defined in the claims.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
